#### How to Calculate Your (Approximate) AP Computer Science A Score

### Chart to Convert to AP Grade Computer Science A

Final Score Range	AP Grade <sup>a</sup>			
62-80	5			
47-61	4			
37-46	3			
29-36	2			
0-28	1			

<sup>&</sup>lt;sup>a</sup>The score range corresponding to each grade varies from exam to exam and is approximate.

## **Diagnostic Test**

# COMPUTER SCIENCE A SECTION I

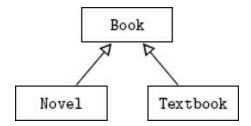

Time—1 hour and 30 minutes Number of questions—40 Percent of total grade—50

**DIRECTIONS:** Determine the answer to each of the following questions or incomplete statements, using the available space for any necessary scratchwork. Then decide which is the best of the choices given and fill in the corresponding oval on the answer sheet. Do not spend too much time on any one problem.

#### **NOTES:**

- Assume that the classes in the Quick Reference have been imported where needed.
- Assume that variables and methods are declared within the context of an enclosing class.
- Assume that method calls that have no object or class name prefixed, and that are not shown within a complete class definition, appear within the context of an enclosing class.
- Assume that parameters in method calls are not null unless otherwise stated.

1. Consider this inheritance hierarchy, in which Novel and Textbook subclasses of Book.

Which of the following is a false statement about the classes shown?

- (A) The Textbook class can have private instance variables that are in neither Book nor Novel.
- (B) Each of the classes—Book, Novel, and Textbook—can have a method computeShelfLife, whose code in Book and Novel is identical, but different from the code in Textbook.
- (C) If the Book class has private instance variables title and author, then Novel and Textbook cannot directly access them.
- (D) Both Novel and Textbook inherit the constructors in Book.
- (E) If the Book class has a private method called readFile, this method may not be accessed in either the Novel or Textbook classes.
- 2. A programmer is designing a program to catalog all books in a library plans to have a Book class that stores features of each book: author, tisonShelf, and so on, with operations like getAuthor, getT: getShelfInfo, and setShelfInfo. Another class, LibraryList, will sto array of Book objects. The LibraryList class will include operations sulistAllBooks, addBook, removeBook, and searchForBook. What is relationship between the LibraryList and Book classes?
  - (A) Composition
  - (B) Inheritance
  - (C) Independent classes
  - (D) Polymorphism
  - (E) ArrayList

3. Consider the following code segment, which is intended to add zero to end of list every time a certain condition is met. You may assume that is an ArrayList<Integer> that contains at least one element.

```
for (Integer num : list)
{
    if (<condition>)
        list.add(0);
}
```

Which of the following errors is most likely to occur?

- (A) ArrayIndexOutOfBoundsException
- (B) IndexOutOfBoundsException
- (C) NullPointerException
- (D) ConcurrentModificationException
- (E) IllegalArgumentException

Questions 4 and 5 refer to the Card and Deck classes shown below.

```
public class Card
    private String suit;
    private int value; //0 to 12
    public Card(String cardSuit, int cardValue)
    {/* implementation
    public String getSuit()
    { return suit; }
    public int getValue()
    { return value; }
    public String toString()
        String faceValue = "";
        if (value == 11)
            faceValue = "J";
        else if (value == 12)
            faceValue = "Q";
        else if (value == 0)
```

```
faceValue = "K";
        else if (value == 1)
            faceValue = "A";
        if (value >= 2 && value <= 10)
            return value + " of " + suit;
        else
            return faceValue + " of " + suit;
    }
}
public class Deck
    private Card[] deck;
    public final static int NUMCARDS = 52;
    public Deck()
    { ...
    /** Simulate shuffling the deck. */
    public void shuffle()
    { . . .
    //Other methods are not shown.
}
```

4. Which of the following represents correct /\* *implementation* \*/ code fo constructor in the Card class?

```
(A) suit = cardSuit;
   value = cardValue;
(B) cardSuit = suit;
   cardValue = value;
(C) Card = new Card(suit, value);
(D) Card = new Card(cardSuit, cardValue);
(E) suit = getSuit();
   value = getValue();
```

5. Consider the implementation of a writeDeck method that is added to the class.

```
/** Write the cards in deck, one per line. */
public void writeDeck()
{
    /* implementation code */
}

Which of the following is correct /* implementation code */?

I System.out.println(deck);

II for (Card card : deck)
    System.out.println(card);

III for (Card card : deck)
    System.out.println((String) card);

(A) I only
(B) II only
(C) III only
(D) I and III only
(E) II and III only
```

6. Refer to the following method that finds the smallest value in an array.

Which replacement(s) for /\* **some value** \*/ will always result in correct execution of the findMin method?

```
I Integer.MIN_VALUE
II Integer.MAX_VALUE
III arr[0]

(A) I only
(B) II only
(C) III only
(D) I and III only
(E) II and III only
```

7. Consider the following loop, where n is some positive integer.

```
for (int i = 0; i < n; i += 2)
{
    if (/* test */)
        /* perform some action */
}</pre>
```

In terms of n, which Java expression represents the maximum number of times that /\* *perform some action* \*/ could be executed?

```
(A) n / 2

(B) (n + 1) / 2

(C) n

(D) n - 1

(E) (n - 1) / 2
```

8. A method is to be written to search an array for a value that is larger the given item and return its index. The problem specification does not index what should be returned if there are several such values in the array. We of the following actions would be best?

- (A) The method should be written on the assumption that there is only one value in the array that is larger than the given item.
- (B) The method should be written so as to return the index of every occurrence of a larger value.
- (C) The specification should be modified to indicate what should be done if there is more than one index of larger values.
- (D) The method should be written to output a message if more than one larger value is found.
- (E) The method should be written to delete all subsequent larger items after a suitable index is returned.
- 9. When will method whatIsIt cause a stack overflow (i.e., cause commemory to be exhausted)?

```
public static int whatIsIt(int x, int y)
{
    if (x > y)
       return x * y;
    else
      return whatIsIt(x - 1, y);
}
```

- (A) Only when x < y
- (B) Only when  $x \le y$
- (C) Only when x > y
- (D) For all values of x and y
- (E) The method will never cause a stack overflow.
- 10. The boolean expression a[i] == max || !(max != a[i]) can be simple to

```
(A) a[i] == max
(B) a[i] != max
(C) a[i] < max || a[i] > max
(D) true
```

- (E) false
- 11. Consider the following code segment.

What is the value of sum as a result of executing the code segment?

- (A) 9
- (B) 11
- (C) 13
- (D) 20
- (E) 33
- 12. Consider a Clown class that has a default constructor. Suppose a ArrayList<Clown> list is initialized. Which of the following will not an IndexOutOfBoundsException to be thrown?

```
private int[] testArray = \{3, 4, 5\};
    /** @param n an int to be incremented by 1 */
    public void increment (int n)
    { n++; }
    public void firstTestMethod()
        for (int i = 0; i < testArray.length; i++)</pre>
            increment(testArray[i]);
            System.out.print(testArray[i] + " ");
        }
    }
    public void secondTestMethod()
        for (int element : testArray)
            increment(element);
            System.out.print(element + " ");
        }
    }
}
```

- 13. What output will be produced by invoking firstTestMethod for a Te object?
  - (A) 3 4 5
  - (B) 4 5 6
  - (C) 5 6 7
  - (D) 0 0 0
  - (E) No output will be produced. An ArrayIndexOutOfBoundsException will be thrown.
- 14. What output will be produced by invoking secondTestMethod for a Te object, assuming that testArray contains 3, 4, 5?
  - (A) 3 4 5
  - (B) 4 5 6
  - (C) 5 6 7

- (D) 0 0 0
- (E) No output will be produced. An ArrayIndexOutOfBoundsException will be thrown.

Questions 15—17 refer to the following Point, Quadrilateral, and Rectangle classes.

```
public class Point
    private int xCoord;
    private int yCoord;
    //constructor
    public Point(int x, int y)
        . . .
    }
    //accessors
    public int get_x()
    {
        . . .
    }
    public int get_y()
    {
        . . .
    }
    //Other methods are not shown.
}
public class Quadrilateral
    private String labels; //e.g., "ABCD"
    //constructor
    public Quadrilateral(String quadLabels)
    { labels = quadLabels; }
    public String getLabels()
    { return labels; }
```

```
public int perimeter()
    { return 0; }
    public int area()
    { return 0; }
}
public class Rectangle extends Quadrilateral
    private Point topLeft;  //coords of top left corner
private Point botRight;  //coords of bottom right
corner
    //constructor
    public Rectangle(String theLabels, Point theTopLeft,
Point theBotRight)
    { /* implementation code */ }
    public int perimeter()
    { /* implementation not shown */ }
    public int area()
    { /* implementation not shown */ }
    //Other methods are not shown.
}
```

15. Which of the following statements about the Point, Quadrilateral, Rectangle classes are false?

I Point is a subclass of Quadrilateral.

II Point is a subclass of Rectangle.

III The Rectangle class inherits the constructor of Quadrilateral.

- (A) I only
- (B) II only
- (C) III only
- (D) I and II only
- (E) I, II, and III

16. Which represents correct /\* *implementation code* \*/ for the Recta constructor?

```
I super(theLabels);
II super(theLabels, theTopLeft, theBotRight);
III super(theLabels);
    topLeft = theTopLeft;
    botRight = theBotRight;

(A) I only
(B) II only
(C) III only
(D) I and II only
(E) II and III only
```

17. Refer to the Parallelogram and Square classes below.

```
public int area()
{ /* implementation not shown */ }
}
```

Consider an ArrayList<Quadrilateral> quadList whose elements are of type Rectangle, Parallelogram, or Square.
Refer to the following method, writeAreas:

What is the effect of executing this method?

}

- (A) The area of each Quadrilateral in quadList will be printed.
- (B) A value of 0 will be printed for each element of quadList.
- (C) A compile-time error will occur, stating that there is no getLabels method in classes Rectangle, Parallelogram, or Square.
- (D) A NullPointerException will be thrown.
- (E) A ConcurrentModificationException will occur.
- 18. Refer to the doSomething method below.

```
// postcondition
public static void doSomething(ArrayList<SomeType> list,
int i, int j)
{
    SomeType temp = list.get(i);
    list.set(i, list.get(j));
    list.set(j, temp);
}
```

Which best describes the *postcondition* for doSomething?

- (A) Removes from list the objects indexed at i and j.
- (B) Replaces in list the object indexed at i with the object indexed at j.
- (C) Replaces in list the object indexed at j with the object indexed at i.
- (D) Replaces in list the objects indexed at i and j with temp.
- (E) Interchanges in list the objects indexed at i and j.
- 19. Consider the NegativeReal class below, which defines a negative number object.

```
public class NegativeReal
{
    private Double negReal;
    /** Constructor. Creates a NegativeReal object whose value is num.
    * @param num a negative real number
    */
    public NegativeReal(double num)
    { /* implementation not shown */ }

    /** @return the value of this NegativeReal */
    public double getValue()
    { /* implementation not shown */ }

    /** @return this NegativeReal rounded to the nearest integer */
    public int getRounded()
    { /* implementation */ }
}
```

Here are some rounding examples:

Negative real number	Rounded to nearest integer
-3.5	-4
-8.97	-9
-5.0	-5

```
-2.487 -2
-0.2 0
```

Which /\* *implementation* \*/ of getRounded produces the desired postcondition?

```
(A) return (int) (getValue() - 0.5);
(B) return (int) (getValue() + 0.5);
(C) return (int) getValue();
(D) return (double) (getValue() - 0.5);
(E) return (double) getValue();
```

20. Consider the following method.

```
public static void whatsIt(int n)
{
    if (n > 10)
        whatsIt(n / 10);
    System.out.print(n % 10);
}
```

What will be output as a result of the method call whatsIt(347)?

- (A)74
- (B) 47
- (C)734
- (D) 743
- (E) 347
- 21. A large list of numbers is to be sorted into ascending order. Assuming t "data movement" is a swap or reassignment of an element, which o following is a true statement?
  - (A) If the array is initially sorted in descending order, then insertion sort will be more efficient than selection sort.
  - (B) The number of comparisons for selection sort is independent of the

- initial arrangement of elements.
- (C) The number of comparisons for insertion sort is independent of the initial arrangement of elements.
- (D) The number of data movements in selection sort depends on the initial arrangement of elements.
- (E) The number of data movements in insertion sort is independent of the initial arrangement of elements.
- 22. Refer to the definitions of ClassOne and ClassTwo below.

```
public class ClassOne
{
    public void methodOne()
    {
        ...
    }

    //Other methods are not shown.
}

public class ClassTwo extends ClassOne
{
    public void methodTwo()
    {
        ...
    }

    //Other methods are not shown.
}
```

Consider the following declarations in a client class. You may assume that ClassOne and ClassTwo have default constructors.

```
ClassOne c1 = new ClassOne();
ClassOne c2 = new ClassTwo();
```

Which of the following method calls will cause an error?

```
I c1.methodTwo();
II c2.methodTwo();
```

III c2.methodOne();

- (A) None
- (B) I only
- (C) II only
- (D) III only
- (E) I and II only
- 23. Consider the code segment

```
if (n == 1)
k++;
else if (n == 4)
k += 4;
```

Suppose that the given segment is rewritten in the form

```
if (/* condition */)
    /* assignment statement */;
```

Given that n and k are integers and that the rewritten code performs the same task as the original code, which of the following could be used as

(1) /\* condition \*/ and (2) /\* assignment statement \*/?

(A) (1) 
$$n == 1 \&\& n == 4$$
 (2)  $k += n$ 

(B) (1) 
$$n == 1 \&\& n == 4$$
 (2)  $k += 4$ 

(C) (1) 
$$n == 1 \mid \mid n == 4$$
 (2)  $k += 4$ 

(D) (1) 
$$n == 1 \mid \mid n == 4$$
 (2)  $k += n$ 

(E) (1) 
$$n == 1 \mid \mid n == 4$$
 (2)  $k = n - k$ 

24. Which of the following will execute *without* throwing an exception?

```
I String s = null;
   String t = "";
   if (s.equals(t))
       System.out.println("empty strings?");
 II String s = "holy";
   String t = "moly";
   if (s.equals(t))
       System.out.println("holy moly!");
III String s = "holy";
   String t = s.substring(4);
   System.out.println(s + t);
(A) I only
(B) II only
(C) III only
(D) I and II only
(E) II and III only
```

25. Three numbers *a*, *b*, and *c* are said to be a *Pythagorean Triple* if and or the sum of the squares of two of the numbers equals the square of the thir programmer writes a method isPythTriple to test if its three param form a Pythagorean Triple:

```
//Returns true if a * a + b * b == c * c; otherwise returns
false.
public static boolean isPythTriple(double a, double b,
double c)
{
    double d = Math.sqrt(a * a + b * b);
    return d == c;
}
```

When the method was tested with known Pythagorean Triples, isPythTriple sometimes erroneously returned false. What was the most likely cause of the error?

(A) Round-off error was caused by calculations with floating-point numbers.

- (B) Type boolean was not recognized by an obsolete version of Java.
- (C) An overflow error was caused by entering numbers that were too large.
- (D) c and d should have been cast to integers before testing for equality.
- (E) Bad test data were selected.
- 26. Refer to the following class containing the mystery method.

```
public class SomeClass
{
    private int[] arr;

    /** Constructor. Initializes arr to contain nonnegative
    * integers k such that 0 <= k <= 9.
    */
    public SomeClass()
    {        /* implementation not shown */ }

    public int mystery()
    {
        int value = arr[0];
        for (int i = 1; i < arr.length; i++)
            value = value * 10 + arr[i];
        return value;
    }
}</pre>
```

Which best describes what the mystery method does?

- (A) It sums the elements of arr.
- (B) It sums the products  $10*arr[0] + 10*arr[1] + \cdots + 10*arr[arr.length-1]$ .
- (C) It builds an integer of the form  $d_1d_2d_3\dots d_n$ , where  $d_1$  = arr[0],  $d_2$  = arr[1], ...,  $d_n$  = arr[arr.length-1].
- (D) It builds an integer of the form  $d_1d_2d_3\dots d_n$ , where  $d_1=\arctan[\arctan.length-1],\ d_2=\arctan[\arcsin.length-2],\ ...,\ d_n=\arctan[0].$
- (E) It converts the elements of arr to base-10.

Questions 27 and 28 refer to the search method in the Searcher class below.

```
public class Searcher
    private int[] arr;
    /** Constructor. Initializes arr with integers. */
    public Searcher()
    { /* implementation not shown */ }
    /** Precondition: arr[first]...arr[last] sorted in
ascending order.
     * Postcondition: Returns index of key in arr. If key not
in arr,
                    returns -1.
     * /
    public int search(int first, int last, int key)
        int mid;
        while (first <= last)</pre>
            mid = (first + last) / 2;
            if (arr[mid] == key) //found key, exit
search
                return mid;
            else if (arr[mid] < key) //key to right of
arr[mid]
                first = mid + 1;
                                      //key to left of
            else
arr[mid]
                last = mid - 1;
                                      //key not in list
        return -1;
    }
}
```

27. Which assertion is true just before each execution of the while loop?

```
(A) arr[first] < key < arr[last]</li>
(B) arr[first] ≤ key ≤ arr[last]
(C) arr[first] < key < arr[last] or key is not in arr</li>
(D) arr[first] ≤ key ≤ arr[last] or key is not in arr
```

- (E) key  $\leq$  arr[first] or key  $\geq$  arr[last] or key is not in arr
- 28. Consider the array a with values

```
4, 7, 19, 25, 36, 37, 50, 100, 101, 205, 220, 271, 306, 321
```

where 4 is a[0] and 321 is a[13]. Suppose that the search method is called with first = 0 and last = 13 to locate the key 205. How many iterations of the while loop must be made in order to locate it?

- (A)3
- (B) 4
- (C)5
- (D) 10
- (E) 13
- 29. Consider the following RandomList class.

```
public class RandomList
    private int[] ranList;
    public RandomList()
    { ranList = getList(); }
    /** @return array with random Integers from 0 to 100
          inclusive */
    public int[] getList()
        System.out.println("How many integers? ");
        int listLength = ...;
                                    //read user input
        int[] list = new int[listLength];
        for (int i = 0; i < listLength; i++)
            /* code to add integer to list */
        return list;
    }
    /** Print all elements of this list. */
    public void printList()
```

```
{ · · · · }
```

Which represents correct /\* code to add integer to list \*/?

```
(A) list[i] = (int) (Math.random() * 101);
(B) list.add((int) (Math.random() * 101));
(C) list[i] = (int) (Math.random() * 100);
(D) list.add(new Integer(Math.random() * 100))
(E) list[i] = (int) (Math.random() * 100) + 1;
```

30. Refer to method insert described here. The insert method has two s parameters and one integer parameter. The method returns the string obta by inserting the second string into the first starting at the position india by the integer parameter pos. For example, if str1 contains xy and contains cat, then

```
insert(str1, str2, 0) returns catxy
insert(str1, str2, 1) returns xcaty
insert(str1, str2, 2) returns xycat
```

Method insert follows:

```
/** Precondition: 0 <= pos <= str1.length().

* Postcondition: If str1 = a_0a_1 ... a_{n-1} and str2 = b_0b_1 ... b_{m-1},

returns a_0a_1 ... a_{pos-1}b_0b_1 ... b_{m-1}

a_{pos}a_{pos+1} ... a_{n-1}

public static String insert(String str1, String str2, int pos)

{

String first, last;

/* more code */

return first + str2 + last;
}
```

Which of the following is a correct replacement for /\* *more code* \*/?

```
(A) first = str1.substring(0, pos);
       last = str1.substring(pos);
    (B) first = str1.substring(0, pos - 1);
       last = str1.substring(pos);
   (C) first = str1.substring(0, pos + 1);
       last = str1.substring(pos + 1);
    (D) first = str1.substring(0, pos);
       last = str1.substring(pos + 1, str1.length());
    (E) first = str1.substring(0, pos);
       last = str1.substring(pos, str1.length() + 1);
31. A matrix (two-dimensional array) is declared as
     int[][] mat = new int[2][3];
   Consider the following method.
     public static void changeMatrix(int[][] mat)
     {
         for (int r = 0; r < mat.length; r++)
              for (int c = 0; c < mat[r].length; c++)
                  if (r == c)
                      mat[r][c] = Math.abs(mat[r][c]);
     }
   If mat is initialized to be
     -1 -2 -6
     -2 -4 5
   which matrix will be the result of a call to changeMatrix(mat)?
   (A) 1 -2 -6
       -2 4 5
    (B) -1 2 -6
        2 -4 5
```

- (C) -1 -2 -6 -2 -4 -5
- (D) 1 2 -6 2 4 5
- (E) 1 2 6 2 4 5

Use the following program description for Questions 32–34.

A programmer plans to write a program that simulates a small bingo game (no more than six players). Each player will have a bingo card with 20 numbers from 0 to 90 (no duplicates). Someone will call out numbers one at a time, and each player will cross out a number on his card as it is called. The first player with all the numbers crossed out is the winner. In the simulation, as the game is in progress, each player's card is displayed on the screen.

The programmer envisions a short driver class whose main method has just two statements:

```
BingoGame b = new BingoGame();
b.playBingo();
```

The BingoGame class will have several objects: a Display, a Caller, and a PlayerGroup. The PlayerGroup will have a list of Players, and each Player will have a BingoCard.

- 32. The relationship between the PlayerGroup and Player classes is an exa of
  - (A) procedural abstraction.
  - (B) data encapsulation.
  - (C) composition.
  - (D) inheritance.
  - (E) independent classes.
- 33. Which is a reasonable data structure for a BingoCard object? Recall that are 20 integers from 0 to 90 on a BingoCard, with no duplicates. There shalso be mechanisms for crossing off numbers that are called, and

detecting a winning card (i.e., one where all the numbers have been crooff).

```
I int[] bingoCard; //will contain 20 integers
                //bingoCard[k] is crossed off by setting it
   to -1.
   int numCrossedOff; //player wins when numCrossedOff
   reaches 20.
 II boolean[] bingoCard; //will contain 91 boolean values,
   of which
                                 //20 are true. All the
   other values are false.
                                //Thus, if bingoCard[k] is
   true, then k is
                                //on the card, 0 <= k <=
   90. A number k is
                                //crossed off by changing
   the value of
                                //bingoCard[k] to false.
   int numCrossedOff;
                         //player wins when numCrossedOff
   reaches 20.
Ш
      ArrayList<Integer> bingoCard; //will contain 20
   integers.
         //A number is crossed off by removing it from the
```

- (A) I only
- (B) II only
- (C) III only
- (D) I and II only

ArrayList.

- (E) I, II, and III
- 34. The programmer decides to use an ArrayList<Integer> to store the nun to be called by the Caller, but there is an error in the code.

//Player wins when bingoCard.size() == 0.

public class Caller

```
f
    private ArrayList<Integer> numbers;

public Caller()
{
        numbers = getList();
        shuffleNumbers();
}

/** Returns the numbers 0...90 in order. */
private ArrayList<Integer> getList()
{ /* implementation not shown */ }

/** Shuffle the numbers. */
private void shuffleNumbers()
{ /* implementation not shown */ }
}
```

When the programmer tests the constructor of the Caller class, she gets a NullPointerException. Which could be the cause of this error?

- (A) The Caller object in the driver class was not created with new.
- (B) The programmer forgot the return statement in getList that returns the list of Integers.
- (C) The declaration of numbers is incorrect. It needed to be private ArrayList<Integer> numbers = null;
- (D) In the getList method, an attempt was made to add an Integer to an ArrayList that had not been created with new.
- (E) The shuffleNumbers algorithm went out of range, causing a null Integer to be shuffled into the ArrayList.
- 35. Consider method findSomething below.

```
/** Precondition: a.length is equal to b.length. */
public static boolean findSomething(int[] a, int[] b)
{
   for (int aValue: a)
   {
      boolean found = false;
      for (int bValue: b)
```

Which best describes what method findSomething does? Method findSomething returns true only if

- (A) arrays a and b contain identical elements in the same order.
- (B) arrays a and b contain identical elements in reverse order.
- (C) arrays a and b are permutations of each other.
- (D) array a contains at least one element that is also in b.
- (E) every element of array a is also in b.
- 36. Consider a program that has a two-dimensional array mat of int values. program has several methods that change mat by reflecting elements of across a mirror placed symmetrically on the matrix. Here are five methods:

		2	4	6		2	4	2
mirrorVerticalLeftToRight	transforms	1	3	5	to	1	3	1
		8	9	0		8	9	8
		2	4	6		6	4	6
mirrorVerticalRightToLeft	transforms	1	3	5	to	5	3	5
		8	9	0		0	9	0
		0	_	0		0	4	_
				6		2		6
mirrorHorizontalTopToBottom	transforms			5	to	1075	3	
		8	9	0		2	4	6
		2	4	6		8	9	0
${\tt mirrorHorizontalBottomToTop}$	transforms	1	3	5	to	1	3	5
		8	9	0		8	9	0
		0						_
		2	4	6		2	4	6
mirrorDiagonalRightToLeft	transforms	1	3	5	to	4	3	5
		8	9	0		6	5	0

Consider the following method that transforms the matrix in one of the ways shown above.

```
public static void someMethod(int[][] mat)
{
    int height = mat.length;
    int numCols = mat[0].length;
    for (int col = 0; col < numCols; col++)
        for (int row = 0; row < height/2; row++)
            mat[height - row - 1][col] = mat[row][col];
}</pre>
```

Which method described above corresponds to someMethod? (A) mirrorVerticalLeftToRight

- (B) mirrorVerticalRightToLeft
- (C) mirrorHorizontalTopToBottom
- (D) mirrorHorizontalBottomToTop
- (E) mirrorDiagonalRightToLeft

Refer to the following for Questions 37 and 38.

A word creation game uses a set of small letter tiles, all of which are initially in a tile bag. A partial implementation of a TileBag class is shown below.

```
public class TileBag
{
    //tiles contains all the tiles in the bag
    private List<Tile> tiles;
    //size is the number of not-yet-used tiles
    private int size;

    //Constructors and other methods are not shown.
}
```

Consider the following method in the TileBag class that allows a player to get a new tile from the TileBag.

```
public Tile getNewTile()
{
   if (size == 0) //no tiles left
      return null;
   int index = (int) (Math.random() * size);
   size--;
   Tile temp = tiles.get(index);
   /* code to swap tile at position size with tile at position index */
   return temp;
}
```

37. Which /\* code to swap tile at position size with tile at position indeperforms the swap correctly?

```
(A) tiles.set(size, temp);
tiles.set(index, tiles.get(size));(B) tiles.set(index, tiles.get(size));
tiles.set(size, temp);
```

```
(C) tiles.swap(index, size);(D) tiles.get(size, temp);
tiles.get(index, tiles.set(size));(E) tiles.get(index, tiles.set(size));
tiles.get(size, temp);
```

- 38. Which is true about the getNewTile algorithm?
  - (A) The algorithm allows the program to keep track of both used and unused tiles.
  - (B) The tiles list becomes one element shorter when getNewTile is executed.
  - (C) The algorithm selects a random Tile from all tiles in the list.
  - (D) The tiles list has used tiles in the beginning and unused tiles at the end.
  - (E) The tiles list contains only tiles that have not been used.
- 39. Consider the following two classes.

```
public class Bird
{
    public void act()
    {
        System.out.print("fly ");
        makeNoise();
    }

    public void makeNoise()
    {
        System.out.print("chirp ");
    }
}

public class Dove extends Bird
{
    public void act()
    {
        super.act();
        System.out.print("waddle ");
```

```
public void makeNoise()
{
    super.makeNoise();
    System.out.print("coo ");
}
```

Suppose the following declaration appears in a class other than Bird or Dove.

```
Bird pigeon = new Dove();
```

What is printed as a result of the call pigeon.act()?

- (A) fly
- (B) fly chirp
- (C) fly chirp waddle
- (D) fly chirp waddle coo
- (E) fly chirp coo waddle
- 40. Consider a method partialProd that returns an integer array prod such for all k, prod[k] is equal to arr[0] \* arr[1] \* · · · arr[k]. For exar if arr contains the values {2,5,3,4,10}, the array prod will contain values {2,10,30,120,1200}.

```
public static int[] partialProd(int[] arr)
{
   int[] prod = new int[arr.length];
   for (int j = 0; j < arr.length; j++)
      prod[j] = 1;
   /* missing code */
   return prod;
}</pre>
```

Consider the following two implementations of /\* *missing code* \*/.

### **Implementation 1**

```
for (int j = 1; j < arr.length; j++)
```

```
{
    prod[j] = prod[j - 1] * arr[j];
}
```

#### **Implementation 2**

```
for (int j = 0; j < arr.length; j++)
    for (int k = 0; k <= j; k++)
    {
        prod[j] = prod[j] * arr[k];
    }</pre>
```

Which of the following statements is true?

- (A) Both implementations work as intended but Implementation 1 is faster than Implementation 2.
- (B) Both implementations work as intended but Implementation 2 is faster than Implementation 1.
- (C) Both implementations work as intended and are equally fast.
- (D) Implementation 1 doesn't work as intended because the elements of prod are incorrectly assigned.
- (E) Implementation 2 doesn't work as intended because the elements of prod are incorrectly assigned.

# COMPUTER SCIENCE A SECTION II

Time—1 hour and 30 minutes Number of questions—4 Percent of total grade—50

**DIRECTIONS:** SHOW ALL YOUR WORK. REMEMBER THAT PROGRAM SEGMENTS ARE TO BEWRITTEN IN JAVA.

Write your answers in <u>pencil only</u> in the booklet provided.

#### NOTES:

- Assume that the classes in the Quick Reference have been imported where needed.
- Unless otherwise noted in the question, assume that parameters inmethod calls are not null and that methods are called only when their preconditions are satisfied.
- Inwriting solutions for each question, youmay use any of the accessiblemethods that are listed in classes defined in that question. Writing significant amounts of code that can be replaced by a call to one of these methods will not receive full credit.
- 1. In this question you will write two methods of an Experiment class handles chemical solutions.

A chemical solution is said to be acidic if it has a pH integer value from 1 to 6 inclusive. The lower the pH, the more acidic the solution.

An experiment has three chemical solutions, numbered 0, 1, and 2, arranged in a line, and a mechanical arm that moves back and forth along the line, stopping at any of the solutions.

A chemical solution is specified by a Solution class shown as follows.

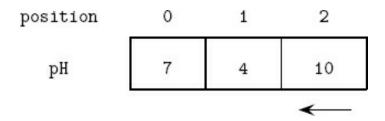

```
public class Solution
{
    private int PH;
    private int positionLabel;

    /** Returns the PH of the solution, an
    * integer ranging from 1 (very acidic) to 14.
    */
    int getPH()
    { return PH; }

    /** Returns the position label of the solution, an
     * integer ranging from 0 to 2, inclusive.
     */
    int getPos()
    { return positionLabel; }

    //Constructors and other methods not shown.
}
```

The experiment keeps track of the solutions and the mechanical arm. The figure below represents the solutions and mechanical arm in an experiment. The arm, indicated by the arrow, is currently at the solution whose position is at 2. The integers in the boxes represent the pH values of the solutions.

In this experiment, the most acidic solution is at position 1, since its pH

value is the lowest. The mechanical arm, which is specified by a position and a direction, is at position 2 and facing left.

The Mechanical Arm class is shown below.

```
public class MechanicalArm
    {
        private int currentPos;
        private boolean facesRight;
        /** Returns the current position of the mechanical
 arm.
        public int getCurrentPos()
        { return currentPos; }
         /** Returns true if the mechanical arm is facing
              right (toward higher position numbers);
              false if it is facing left.
        public boolean isFacingRight()
        { /* implementation not shown */ }
        /** Changes direction of the mechanical arm.
        public void changeDirection()
        { /* implementation not shown */ }
         /** Moves the mechanical arm forward numLocs
              positions in its current direction.
              Precondition: numLocs >= 0.
              Postcondition: 0 <= currentPos <=2.</pre>
        public void moveForward (int numLocs)
        { /* implementation not shown */ }
        //Constructors and other methods not shown.
    }
An experiment is represented by the Experiment class shown below.
    public class Experiment
    {
        private MechanicalArm arm;
        private Solution s0, s1, s2;
```

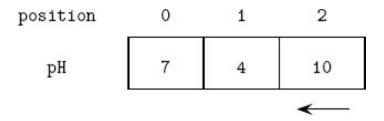

```
/** Resets the experiment, such that the mechanical
arm has

    * a current position of 0 and is facing right.
    */
    public void reset()
    { /* to be implemented in part(a) */ }

    /** Returns the position of the most acidic
solution,
    * or -1 if there are no acidic solutions, as
    * described in part(b).
    */
    public int mostAcidic()
    { /* to be implemented in part(b) */ }
}
```

(a) Write the Experiment method reset that places the mechanical arm facing right, at index 0.

For example, suppose the experiment contains the solutions with pH values shown. The arrow represents the mechanical arm.

A call to reset will result in

Class information for this question

<u>public class Solution</u>

```
private int PH
private int positionLabel
int getPH()
int getPos()
public class MechanicalArm
private int currentPos
private boolean facesRight
int getCurrentIndex()
boolean isFacingRight()
void changeDirection()
void moveForward(int numLocs)
<u>public class Experiment</u>
private MechanicalArm arm
private Solution s0, s1, s2
public void reset()
public int mostAcidic()
```

Complete method reset below.

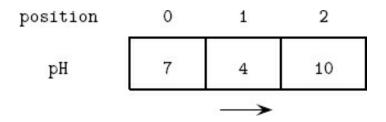

```
/** Resets the experiment, such that the mechanical arm
has
  * a current position of 0 and is facing right.
  */
public void reset()
```

(b) Write the Experiment method mostAcidic that returns the position of the most acidic solution and places the mechanical arm facing right at the location of the most acidic solution. A solution is acidic if its pH is less than 7. The lower the pH, the more acidic the solution. If there are no acidic solutions in the experiment, the mostAcidic method should return -1, and place the mechanical arm at position 0, facing right.

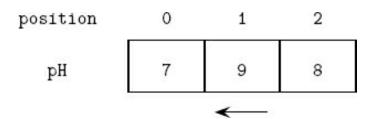

For example, suppose the experiment has this state:

position	0	1	2
рН	7	4	10
,			<b>←</b>

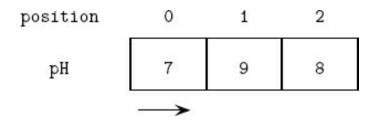

A call to mostAcidic should return the value 1 and result in the following state for the experiment:

If the experiment has this state,

a call to mostAcidic should return the value -1 and result in the following state for the experiment:

Complete method mostAcidic below.

```
/** Returns the position of the most acidic solution,
  * or -1 if there are no acidic solutions, as
  * described in part(b).
  */
```

```
public int mostAcidic()
```

2. This question involves keeping track of details for a world cruise, usi Cruise class. A Cruise object is created with two parameters, the numb people currently signed up for the cruise, and the current price.

The Cruise class provides a constructor and the following methods.

- setPrice, which can change the price of the cruise.
- checkResponse, which increments the count of people if someone has requested the cruise using a phrase that includes the word "cruise". You may assume all lowercase letters.
- calculateRevenue, which returns the number of signups so far multiplied by the current price. Note that if more than 300 people have signed up for the cruise, everyone will receive a \$500 discount off the current price. If between 200 and 300 (including 200) people have signed up, everyone will receive a \$350 discount off the current price.

The following table contains sample code and corresponding results.

<b>Statements and Expressions</b>	Comments
Cruise cr = newCruise(78,	There are 78 signups so far, and the cruis
4000);	price is \$4,000.
<pre>cr.setPrice(5000);</pre>	Changes the price to \$5,000.
<pre>cr.checkResponse("world cruise");</pre>	Increments signup number to 79.
<pre>cr.checkResponse("ship trip");</pre>	Does not change number. It is still 78.
<pre>cr.calculateRevenue();</pre>	With 79 signups and price \$5,000, return × 5000.
<pre>Cruise cr1 = newCruise(200, 2000); cr1.calculateRevenue();</pre>	Returns 200 × 1650
Cruise cr2 = newCruise(397, 6000);	1030 · 1030
<pre>cr2.calculateRevenue();</pre>	Returns 397 × 5500

Write the complete Cruise class, including the constructor and any

required instance variables and methods. Your implementation must meet all specifications and be consistent with the examples shown above.

3. A text-editing program uses a Sentence class that manipulates a s sentence. A sentence contains letters, blanks, and punctuation. The character in a sentence is a letter, and the last character is a punctuation r Any two words in the sentence are separated by a single blank. A primplementation of the Sentence class is as follows.

```
public class Sentence
       /** The sentence to manipulate */
       private String sentence;
       /** Returns an ArrayList of integer positions
containing a
           blank in this sentence. If there are no blanks
in the
        * sentence, returns an empty list.
       public ArrayList<Integer> getBlankPositions()
       \{ /* \text{ to be implemented in part (a) */ } \}
            Returns the number of words in this sentence
            Precondition: Sentence contains at least one word.
       public int countWords()
       { /* implementation not shown */ }
       /** Returns the array of words in this sentence.
           Precondition:
           - Any two words in the sentence are separated by
one blank.
          - The sentence contains at least one word.
           Postcondition: String[] contains the words in this
sentence.
        */
       public String[] getWords()
       { /* to be implemented in part (b) */ }
       //Constructor and other methods are not shown.
  }
```

(a) Write the Sentence method getBlankPositions, which returns an ArrayList of integers that represent the positions in a sentence containing blanks. If there are no blanks in the sentence, getBlankPositions should return an empty list.

Some results of calling getBlankPositions are shown below.

```
Sentence Result of call to getBlankPosition
I love you! [1, 6]
The cat sat on the mat. [3, 7, 11, 14, 18]
Why? [7]
```

Complete method getBlankPositions below.

/\*\* Returns an ArrayList of integer positions containing
a

\* blank in this sentence. If there are no blanks in the

\* sentence, returns an empty list.
\*/

public ArrayList<Integer> getBlankPositions()

(b) Write the Sentence method getwords, which returns an array of words in the sentence. A word is defined as a string of letters and punctuation, and does not contain any blanks. You may assume that a sentence contains at least one word.

Some examples of calling getwords are shown below.

```
Sentence
The bird flew away.
Wow!
Hi! How are you?

Result returned by getWords
{The, bird, flew, away.}
{Wow!}
{Hi!, How, are, you?}
```

In writing method getWords, you *must* use methods getBlankPositions and countWords.

Complete method getWords below.

/\*\* Returns the array of words in this sentence.

#### \* Precondition:

\* - Any two words in the sentence are separated by one blank.

- \* The sentence contains at least one word.
- $\begin{tabular}{ll} * & \textbf{Postcondition:} & \textbf{String[]} & \textbf{contains} & \textbf{the words in this sentence.} \end{tabular}$

```
*/
public String[] getWords()
```

4. This question manipulates a two-dimensional array. In parts (a) and (b) will write two methods of a Matrix class.

In doing so, you will use the reverseArray method shown in the class below.

```
public class ArrayUtil
{
    /** Reverses elements of array arr.
    * Precondition: arr.length > 0.
    * Postcondition: The elements of arr have been reversed.
    */
    public static void reverseArray(int[] arr)
    { /* implementation not shown */ }

    //Other methods are not shown.
}
```

Consider the following incomplete Matrix class, which represents a twodimensional matrix of integers. Assume that the matrix contains at least one integer.

```
public class Matrix
{
    private int[][] mat;

    /** Constructs a matrix of integers. */
    public Matrix (int[][] m)
    { mat = m; }

    /** Reverses the elements in each row of mat.
    * Postcondition: The elements in each row have been reversed.
    */
    public void reverseAllRows()
    { /* to be implemented in part (a) */ }
```

(a) Write the Matrix method reverseAllRows. This method reverses the elements of each row. For example, if mat1 refers to a Matrix object, then the call mat1.reverseAllRows() will change the matrix as shown below.

		Befo	re call		After	r call		
	0	1	2	3	0	1	2	3
0	1	2	3	4	0 4	3	2	1
1	5	6	7	8	1 8	7	6	5
2	9	10	11	12	2 12	11	10	9

In writing reverseAllRows, you *must* call the reverseArray method in the ArrayUtil class.

Complete method reverseAllRows below.

```
/** Reverses the elements in each row of mat.
```

\* **Postcondition:** The elements in each row have been reversed.

```
*/
public void reverseAllRows()
```

(b) Write the Matrix method reverseMatrix. This method reverses the elements of a matrix such that the final elements of the matrix, when read in row-major order, are the same as the original elements when read from the bottom corner, right to left, going upward. Again let mat1 be a reference to a Matrix object. The call mat1.reverseMatrix() will change the matrix as shown below.

	Befor	e call		Afte	After call		
	0	1		0	1		
0	1	2	0	6	5		
1	3	4	1	4	3		
2	5	6	2	2	1		

In writing reverseMatrix, you *must* call the reverseAllRows method in part (a). Assume that reverseAllRows works correctly regardless of what you wrote in part (a).

Complete method reverseMatrix below.

```
/** Reverses the elements of mat, as described in part
(b).
 */
public void reverseMatrix()
```

#### STOP END OF EXAM
